

# INDIAN MARITIME UNIVERSITY

(A Central University, Government of India)

## B. Tech (Marine Engineering)

Semester-III

Dec-2019/Jan-2020 End Semester Examination

### Applied Thermodynamics-II

(UG11T3303)

Date: 14/12/2019

Maximum marks: 70

Time: 3 Hrs

Pass Marks: 35

Note: Use of steam table and Mollier chart is allowed

#### PART-A

(Marks: 10×2 = 20)

(All Questions are compulsory)

1. What is percentage excess air? Why is it supplied?
2. Write any three combustion equations
3. What is nozzle efficiency?
4. What are the effects on friction on flow through nozzle?
5. State and explain Fourier's law of heat conduction
6. Write an expression for thermal resistance of a composite cylinder
7. Define Reynolds number and Nusselt number
8. Define absorptivity and reflectivity
9. Draw the neat and labeled temperature variation diagram for parallel flow and counter flow heat exchanger
10. What is LMTD? Write its formula

#### PART-B

(Marks: 5×10 = 50)

(Answer any 5 of the following 7 Questions)

11. The gravimetric analysis of hydrocarbon gives: 86% carbon, 14% Hydrogen. Determine the percentage analysis of combustion products by mass and by volume when 50% excess air is supplied for the combustion. (10)
12. a) Explain choked nozzle and stagnation properties in short. (4)  
b) Air is expanded reversibly and adiabatically in a nozzle from 13 bar and 150°C to a pressure of 6 bar. The inlet velocity of the nozzle is very small and the process occurs under steady flow conditions. Calculate the exit velocity of the nozzle. ( $\gamma$  for air=1.4) (6)
13. A convergent-divergent nozzle is to be designed in which steam initially at 14 bar and 275°C is to be expanded down to a back pressure of 1.05 bar. Assuming 12% of the total isentropic enthalpy drop to be effective in the divergent part of the nozzle. Determine the necessary throat and exit diameters of the nozzle for a steam discharge of 500 kg/hr. ( $n=1.3$ ) (10)

- 14. a)** Derive the expression for heat transfer through composite cylinder. (6)
- b)** A cold room has one of the walls  $5 \text{ m} \times 2.5 \text{ m}$  made of bricks  $12 \text{ cm}$  thick insulated externally by cork slab  $8 \text{ cm}$  thick. Cork is protected externally by  $2.5 \text{ cm}$  wood. Estimate the heat loss through the wall in 24 hours, if the interior of the cold room is maintained at a temperature of  $0^\circ\text{C}$  and the outside temperature is  $20^\circ\text{C}$ . Thermal conductivities for brick, cork and wood are  $0.93$ ,  $0.044$  and  $0.175 \text{ W/m}^\circ\text{K}$  respectively. (4)
- 15. a)** A thick walled tube of stainless steel with  $20 \text{ mm}$  inner diameter and  $40 \text{ mm}$  outer diameter ( $K_{\text{steel}}=40 \text{ W/m}^\circ\text{C}$ ) is covered with a  $30 \text{ mm}$  layer of asbestos insulation ( $K_{\text{asbestos}}=0.2 \text{ W/m}^\circ\text{C}$ ). If the inside wall temperature of the pipe is maintained at  $600^\circ\text{C}$  and outside insulation at  $100^\circ\text{C}$ . Calculate heat loss per meter length of tube (6)
- b)** Write Newton's law of cooling and Explain forced and natural convection with examples of each? (4)
- 16. a)** Water flows inside a tube  $45 \text{ mm}$  in diameter and  $3.2 \text{ m}$  long at a velocity of  $0.78 \text{ m/s}$ . Determine the heat transfer coefficient and rate of heat transfer if the mean water temperature is  $50^\circ\text{C}$  and wall is isothermal at  $70^\circ\text{C}$ . For water at  $50^\circ\text{C}$  take  $k=0.66 \text{ W/m}^\circ\text{K}$ , kinematic viscosity =  $0.478 \times 10^{-6} \text{ m}^2/\text{s}$  and Prandtl number =  $2.98$ . Take  $Nu=0.023(Re)^{0.8}(Pr)^{0.4}$  (6)
- b)** Explain
- i) Black body
  - ii) Total emissive power and
  - iii) Emissivity
- (4)
- 17. a)** How the heat exchangers are classified? (4)
- b)** A counter flow heat exchanger cools  $1400 \text{ kg/hr}$  of oil having heat capacity of  $3 \text{ kJ/kg}^\circ\text{K}$  from  $100^\circ\text{C}$  to  $30^\circ\text{C}$  by water initially at  $20^\circ\text{C}$ . The quantity of water fed is  $1300 \text{ kg/hr}$ . Calculate water outlet temperature and heat transfer area for overall heat transfer co-efficient of  $4000 \text{ kJ/hr-m}^2$ . (Take specific heat of water as  $4.18 \text{ kJ/kgK}$ ) (6)
